# Correctness of the Langevin Solver

- Solver only works if drag and diffusion is added (but is noisy) → Check parameters
- Stops working after 122 timesteps without Langevin Terms (similarly if only one of the collisional terms is added)

## Possible Sources of Error:

- Constant focusing can't contain accelerating particles
- Particles leave spatial and velocity Domain
- Wrong parameter set

- Solver / Timestepping runs now on GPU
- Data Dumping still facing issues due to incorrect memory spaces
